

Prostate Cancer

The prostate is the gland below a man's bladder that produces fluid for semen.

Prostate cancer is the third most common cause of death from cancer in men of all ages. It is rare in men younger than 40.

Levels of a substance called prostate specific antigen (PSA) is often high in men with prostate cancer. However, PSA can also be high with other prostate conditions. Since the PSA test became common, most prostate cancers are found before they cause symptoms.

Symptoms of prostate cancer may include:

- Problems passing urine, such as pain, difficulty starting or stopping the stream, or dribbling
- Low back pain
- Pain with ejaculation

Prostate cancer treatment often depends on the stage of the cancer. How fast the cancer grows and how different it is from surrounding tissue helps determine the stage. Treatment may include surgery, radiation therapy, chemotherapy or control of hormones that affect the cancer.
